Document online

Document Source

Document PDF

Experimental repo for building openscad files into different outputs.

This is still work in progress but can already build a png and stl of each scad file in the opescad directories.

See the online or pdf versions for the images as the readme is really only the source and right now is not WYSIWYG!

Output

Amplifier - Project

VacuumPreAmplifierBase - 3D Object

housing a retro vacuum tube china preamp.

Have a nice wooden box that is looking for some use as a housing The pre-amp is a cheap vacuum tube type sourced from aliexpress https://a.aliexpress.com/_B0MVMZ

I've created an openscad model of the Box based on some measurements with a calliper. The model is designed to help assess where to drill holes and to print a guide to drill the holes. The preamp has a power input (12v~) an in and an output (headphone jack) and a Volume potentiometer. Also the housing is to expose the Vacuum Tubes to the interested viewer. Since the lid is hinged and the relative position of the tubes to the lid, when opening, is difficult to eyeball the model was created to try out different Hole placements as well as providing a template for Drill guides.

Axle - Project

Axle - 3D Object

required a screw and didn't have one.

Figure 2. image

Listing 2. Openscad source

```
// axle for bearing for filament roller
// had no screw printed one ...
// the free end can be melted when the axle has been inserted so that no
// fastener is required
$fn=360;
cylinder (h=22,d=3.5);
cylinder (h=3,d=7);
```

Howth-cieling-spots - Project

The spots for the ceiling in Howth needed replacing and the replacement spots had a few millimeters too little radius so that they didn't cover the hole properly in all places.

The lamp ring was a quick fix that turned out quite well and looks good.

lampRing - 3D Object

This object is not very complex and it's really just a few cylinders laid on top of one another with a few holes cut out for the lamp.

Figure 3. image

Listing 3. Openscad source

```
//for LED lamps in ceiling in Howth
// the originals are wider and therefore the new ones need a spacer to cover the
hole
//colour is white
//led lamps are 105mm Diameter (4 lamps)

lampD=105;
lampH=2;
holeD=99;
coverD=125;
coverInD=99;

outerR);
}
```

{

desk - Project

fastener - 3D Object

This is a fastener for a writing Desk.

The idea is to add a magnet to hold it up and to print it so that it does not require a bearing.

- V1 is the first prototype for a first print test and fitting test
 - fits well and axle didn't print free so need update
 - The reason was that the axle required supports winside the part to build
 - Changed the axle to 45 degree angles to negate the need for supports
- V2 added a better axle but didn't get printed
- V3 added a better cutout and is printed
 - The cutout is currently a dummy pending getting the axle to work to try it out with magnets taped into place
 - axle prints freely so moving on to screw holes, magnets, and covers
- V4 Added final OCD logo and screw caps etc.
 - Mounted and working.

case - 3D Object

A case for an odroid handgeld console and accessories.

The edges are rounded and there are cutouts for the parts that protrude from the console.

```

openai - Project

I decided to have a go to see where openAI's chatGPT has its limits.

And it does have limits.

It's interesting to see that while it seems to know what an object might consist of it has a very hard time making the object in any way accurate.

In any case it's Interesting.

esp8266case-chatgpt - 3D Object

This one is also interesting in that it does some difference etc but it's really not a model of a case.

It looks like it gets the basic premise of subtracting one thing from another etc.

On the other hand it doesn't seem to have a clue about dimensions.

Either way an interesting experiment which shows up the limitations of GPT models.

Figure 24. image

Listing 24. Openscad source

```
// Create the base of the case
translate([0, 0, 5]) {
  cube([30, 20, 10]);
}

// Create the sides of the case
translate([0, 0, 15]) {
  cube([30, 20, 10]);
  translate([15, 10, 15]) {
    rotate([0, 90, 0]) {
      cube([30, 20, 10]);
    }
  }
}

// Create the lid of the case
translate([0, 0, 25]) {
```

```
cube([30, 20, 5]);
translate([15, 10, 25]) {
  rotate([0, 90, 0]) {
    cube([30, 20, 5]);
  }
}

// Create the opening for the ESP8266
translate([15, 10, 30]) {
  rotate([0, 90, 0]) {
    cube([20, 15, 5]);
  }
}
```

solar-generator-chatgpt - 3D Object

This is also an interesting experiment.

I asked chatGPT to make a solar generator openscad model and this came out.

On the other hand it seems to be good at figuring out what should be part of a solar generator.

I'll have to take closer look of what it did here and how hard it is to fix it.

This could be promising in total but right now it more or less seems to have hit a brick wall that seems to relate to dimensions etc.

In other words it's good at creating a structure but not so good at understanding the physics of what it made.

Figure 25. image

Listing 25. Openscad source

```
// Create the base of the solar generator
translate([0, 0, 5]) {
  cube([200, 100, 10]);
}

// Create the solar panels of the solar generator
translate([0, 0, 15]) {
  for (i = [0:3]) {
    rotate([0, i * 90, 0]) {
      cube([100, 10, 10]);
    }
  }
}

// Create the handle of the solar generator
translate([100, -50, 25]) {
  rotate([90, 0, 0]) {
    cylinder(r=5, h=50);
  }
}
```

```
}  
}  
  
// Create the control panel of the solar generator  
translate([0, 0, 65]) {  
  cube([20, 20, 10]);  
  translate([5, 5, 10]) {  
    rotate([0, 45, 0]) {  
      cube([10, 10, 10]);  
    }  
  }  
}  
  
// Create the outlets of the solar generator  
translate([0, 0, 75]) {  
  for (i = [0:2]) {  
    translate([i * 35, 0, 0]) {  
      rotate([0, 90, 0]) {  
        cylinder(r=5, h=10);  
      }  
    }  
  }  
}
```

teacup-chatgpt - 3D Object

What chatGPT thinks a teacup could look like in openscad.

It's interesting to see that it's structured and syntactically more or less correct but is also not a tea cup.

Figure 26. image

Listing 26. Openscad source

```
// Create the base of the tea cup
cylinder(r=50, h=10);

// Create the handle of the tea cup
translate([-60, 30, 0]) {
  rotate([0, 90, 0]) {
    cylinder(r=10, h=30);
  }
}

// Create the rim of the tea cup
translate([0, 0, 10]) {
  cylinder(r=60, h=5);
}

// Create the body of the tea cup
translate([0, 0, 15]) {
  cylinder(r=50, h=50);
}
```

```

}

// Cut out the handle from the body of the tea cup
translate([-60, 30, 0]) {
  rotate([0, 90, 0]) {
    difference() {
      cylinder(r=50, h=50);
      cylinder(r=10, h=30);
    }
  }
}

```

piZero - Project

- Required for a rpi zero cluster
- need to add a few extra parts
 - a holder for a USB hub
 - A holder for the PSU
 - some extra stuff

RPi_zero_mount - 3D Object

This also is NOT one of mine but I've cleaned it up a bit as it wasn't displaying correctly. I needed it for a pi cluster and as it's quite good I didn't reinvent the wheel here.

Appendix A: To do

Right now the github source is not perfect as the readme does not display the images when viewed in github.

- ☐ Add a readme in the directories or fix asciidoc to deal with asciidoc not showing in github
- ☐ Split the build scriupts to handle scad/plantuml/asciidoc in separate steps depending on changes
 - ☒ The scad build already only builds scad files that exist and is fed by find
 - ☐ Feed with a list of changed scad files instead of the more simple find
- ☐ Add further process steps for the images like meshlabserver to do further processing:
 - Stuff (glass rendering, wireframe, mesh magic, stats, etc.)
- ☒ Need to add subdirectories to pool projects together
 - ☒ build index for subdirs
 - ☒ need to make the scad build fit to the subdir model
 - ☒ add check for empty directory (no scad files)
 - ☒ only build scad files and only run container with scad files (empties ignored)
- ☐ Add further optional scad steps
 - ☐ Need to add view parameters as options
 - ☐ Need to add animation options
- ☒ Need to add text display option for each item

- ☐ Allow adding photos to the objects or projects to show makes
- ☐ investigate including a js or similar stl viewer for html
